OPEN AGENT HACKATHON 2026 · TRACK 1 — SOLVING FRAGMENTED INTELLIGENCE

RecallWhy

Agents that tell a retailer which recalled products are on its shelves, which lots, which stores, how many customers to call — **and why they believe it.**

Zetaris federated SQL · Meterless H-MEM + World Model + Markovian · Meterless Nightshift · NVIDIA Nemotron 3 Ultra + 3.5 Lightning · real products from USDA FoodData Central and Open Food Facts

Mike Kim · solo

github.com/mikey92/recallwhy

Over 500 federal recall notices since July. Each one is a manual cross-check.

A regional retailer's **product-safety / QA manager** reads every CPSC and FDA notice and must answer:

- Do we sell this — or something that only looks like it?
- Which lots? Which stores still hold them?
- How many customers bought it since the recall began?
- Who supplied it?

> **Dec 2025:** FDA warning letters to Kroger, Albertsons, Target and Walmart — recalled infant formula still on shelves in 175+ locations across 36 states, up to three weeks. Staff cited "confusion regarding which specific lots were affected."

184 + 333

CPSC recalls and FDA food enforcement reports, 1 Jul – 21 Oct 2026 (snapshot of 22 Oct in `sample/`; RecallWhy reads the same feeds live)

The answers live in four systems that were never meant to meet — two **recall feeds**, the **ERP** and the **supplier portal** — each writing a product its own way: UPC-12 in the ERP, GTIN-14 from a third of suppliers, digits buried in notice text. A wrong "not ours" leaves a contaminated lot on the shelf; a wrong "ours" pulls good stock.

2 · SOLUTION

Five agents map the fragments, then investigate every recall and return a verdict with its evidence.

Cartographer

Lists every Zetaris source and column, profiles identifiers, tests cross-source joins. Finds the GTIN-14 suppliers upfront. When the Auditor hits rows the key can't reach, it diagnoses that supplier, tests the fix on all its ship notices, and corrects the map.

Scout

Reads both live feeds and the item master through Zetaris; one federated UPC sweep; opens a case per recall that touches the catalog.

Investigator

UPC / model rules, Nemotron judge for text matches, lot codes, prior decisions from H-MEM, exposure by store and lot with federated SQL.

Auditor

Can block. Re-checks the live notice, quotes and lots verbatim, re-derives every number with its own SQL, checks each brief sentence. ≤2 revisions, then a human.

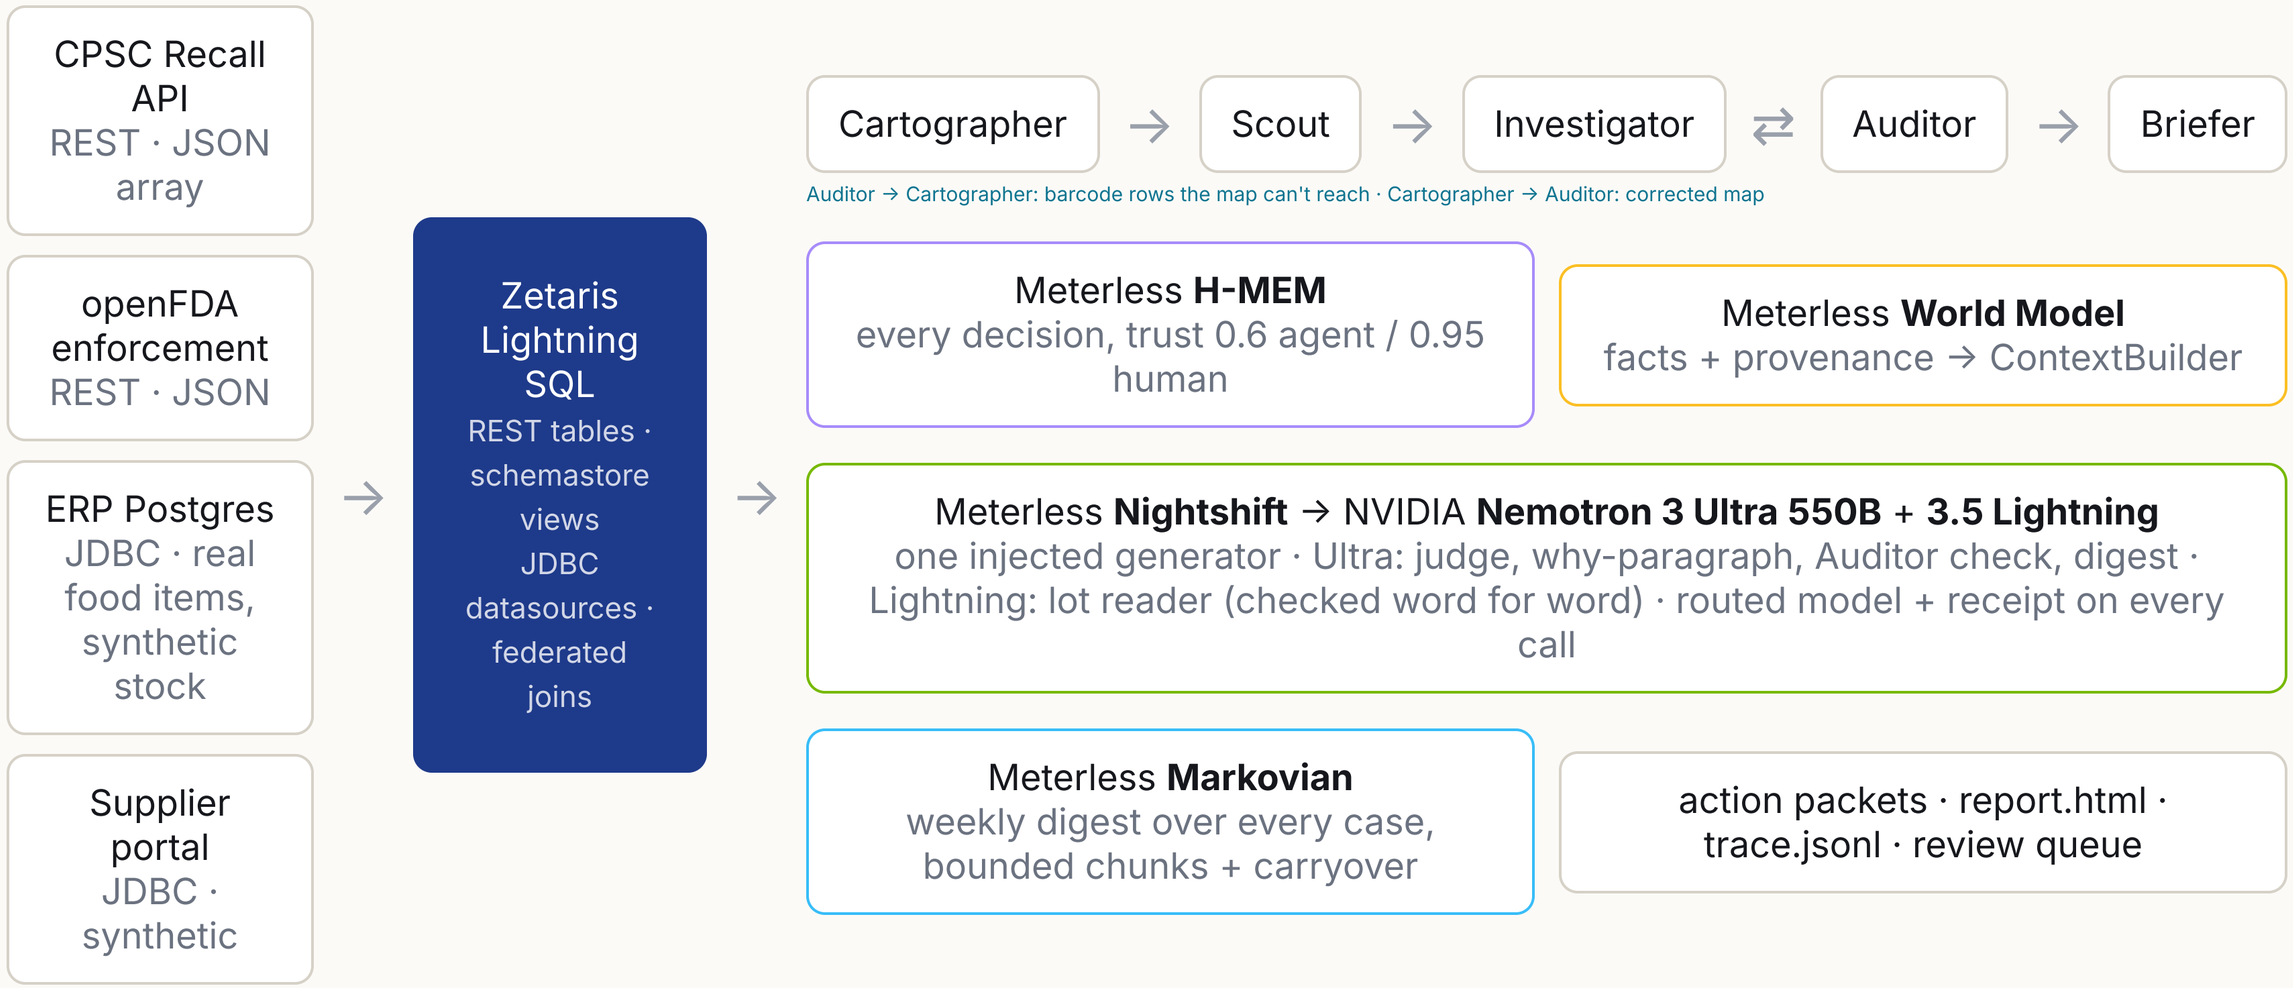

Briefer

Writes only from the World Model context: numbered evidence, each with the SQL or model call behind it. Then the action packet and the weekly digest.

ACT NOW | NOTIFY | NO EXPOSURE | NOT OURS | NEEDS HUMAN

3 · ARCHITECTURE

Every agent reads data only through Zetaris.

4 · STACK

Small, typed, runnable from a clean clone.

LAYER	WHAT
Data access	Zetaris Lightning SQL over its REST API (`/api/proxy/sql-editor/sqls/run-query`)
Agents	TypeScript on Node 22, no agent framework — five agents, one orchestrator, one trace
Memory, state, long reads	Meterless H-MEM, World Model and Markovian reference engines (Apache-2.0), mounted in `src/engines/`
Model	Meterless **Nightshift** Runtime API (OpenAI-compatible) → NVIDIA **Nemotron 3 Ultra 550B-A55B** (judge, briefs, Auditor check, digest) + **Nemotron 3.5 Lightning 30B-A3B** (lot codes); no model and a human queue when Nightshift is absent
Retailer data	Postgres 16 in Docker — food items are real products (USDA FoodData Central, Open Food Facts: 95 recalled, 86 same-brand, 260 more); stores at real SNAP-authorized supermarket locations (USDA FNS); stock, sales and ship notices synthetic
Entry points	`POST /run` · `POST /approve` API · Dockerfile · CLI · live trace viewer · review screen
No-credential mode	`SAMPLE_MODE=true`: same agents and SQL on an in-process DuckDB stand-in, labelled SAMPLE
Development	Cursor (agent scaffolding, generator, SQL layer, tests) · 120 tests incl. Meterless engine tests

5 · HOW ZETARIS AND METERLESS ARE USED

Load-bearing, not bolted on.

Zetaris

- Cartographer maps sources with Zetaris's catalog: `SHOW DATASOURCES`, `DESCRIBE DATASOURCE TABLE`, `SHOW LIGHTNING DATABASES` → profiles and join tests
- 2 live Lightning REST tables → schemastore views
- 2 JDBC datasources (ERP, supplier portal)
- Scout: **REST × JDBC** join — live FDA notice digits ⋈ ERP UPCs
- Investigator: ship notices ⋈ suppliers ⋈ ERP item master
- Auditor: re-queries the live notice and re-aggregates every number itself
- **Writes back**: a proven supplier rule becomes the view `reconciled.ship_notice_item_keys`, checked with `INFER SQLTABLE SOURCES` and `RUN DQ` (0 invalid)
- Setup is code: `npm run setup:zetaris`

Meterless

- **H-MEM**: every adjudication stored with trust; human decisions (0.95) are followed on the next run; audited agent decisions are reused without a model call; trust ledger logs reads/writes
- **World Model**: recalls, cases, findings as facts; every write carries provenance (agent, SQL id, model call)
- **ContextBuilder** is the Briefer's only input — it cannot cite what the team didn't establish
- **Markovian**: the weekly digest reads every case of a run in bounded chunks with a compressed carryover (≤256 tokens)
- **Nightshift** is the primary AI provider: every model call, with its receipt and routed model in the trace
- Engines byte-identical to Meterless@1742dec and green on the **upstream conformance suites** (13/13, 8/8, 8/8) in CI
- **Scout Intent**: signed execution contracts on every write; injection guard 10/10 on Scout's adversarial set; every model call routed by intent and risk (lot reads → Lightning, judging → Ultra, never a smaller fallback)
- Markovian digest: **90% fewer prompt tokens** than re-reading earlier batches (13,033 vs 133,522)

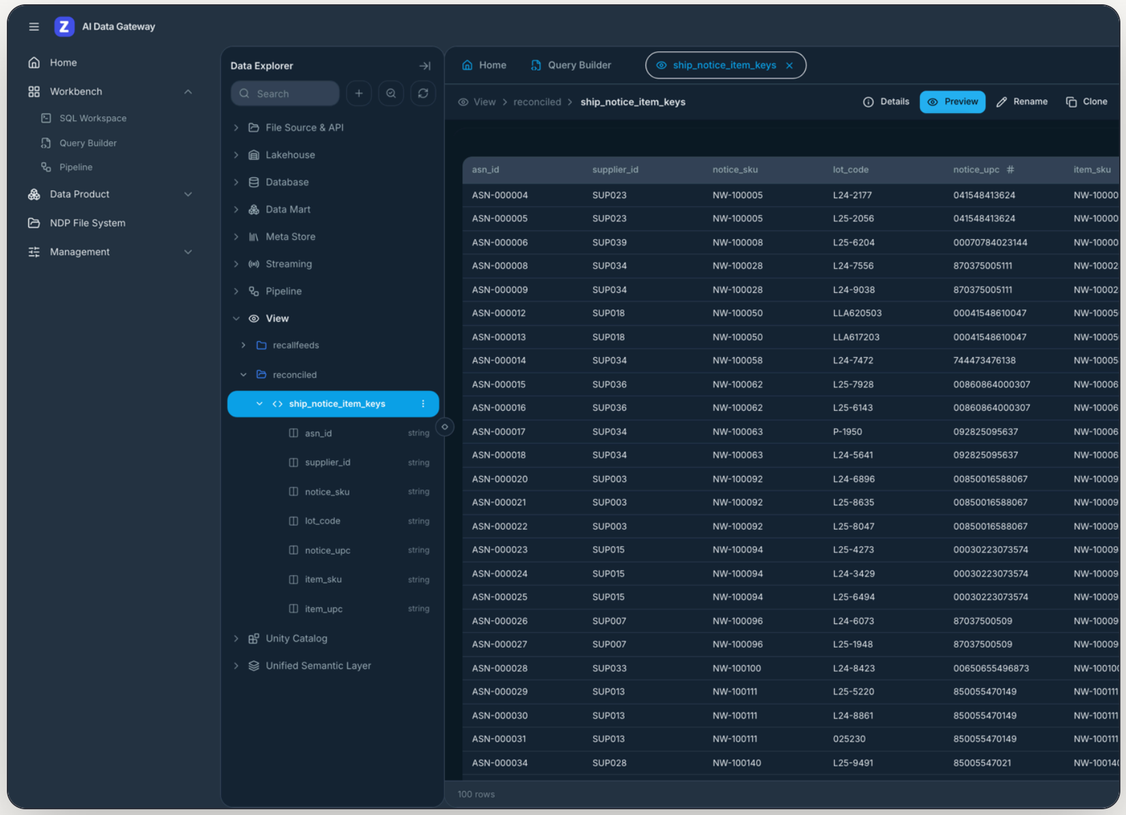

5B · ONE LIVE RECALL, END TO END

A live FDA notice to a pull list, through Zetaris.

H-0007-2027, Mezzetta Golden Greek peperoncini, read from the live feed on 26 Oct:

1. **Scout** reads the live FDA feed through Zetaris (REST) and sweeps it against the ERP (JDBC): our UPC 073214003280 is printed in the notice.
2. **Investigator**: Nemotron 3 Ultra dismisses a look-alike Mezzetta pasta sauce, Nemotron 3.5 Lightning reads lot 720106; SQL: 12 units on hand in 2 stores, one in NY, which the notice does not list.
3. **Auditor** blocks the shortcut: the supplier's ship notices reach the lot by SKU, **0 by barcode** → sends the rows to the Cartographer.
4. **Cartographer**: SUP007 drops the check digit — proven on **458 of 458** ship notices, written back to Zetaris with lineage + DQ rule 0 invalid; the USL key now reaches **12,554 of 14,244**. Two rules from earlier runs were re-proven first.
5. **Auditor** re-derives every number with its own SQL → approved. **Packet**: pull 12 units in 2 stores, supplier request, notice for at most 12 customers. A person approves; nothing is sent.

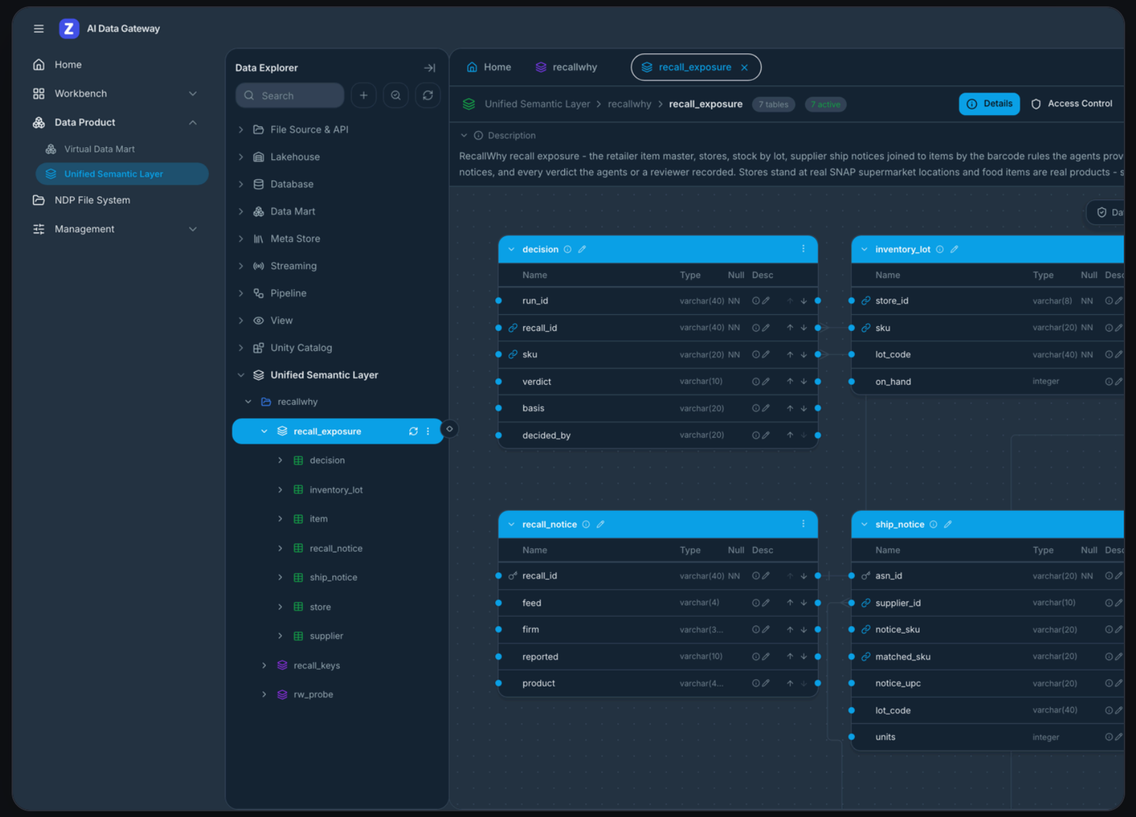

Trace: examples/output/example_4/trace.jsonl, seq 104–170. The whole run, 39 live notices to 5 packets: 4 min 18 s.

The corrected join in Zetaris's own Data Explorer: `reconciled.ship_notice_item_keys`, where suppliers' 11-digit barcodes now meet our 12-digit UPCs. Any Zetaris user can query it.

5C · A GOVERNED MODEL IN ZETARIS

The joins the agents rely on, as keys Zetaris checks.

USL `recall_exposure` in Zetaris's Data Explorer: 7 tables, all active, described, with primary and foreign keys and 18 data-quality rules.

- **The barcode key** `ship_notice.matched_sku → item`: after every map correction the Cartographer re-binds it and Zetaris's DQ engine counts the ship notices no proven rule reaches — **1,690 of 14,244** after three proven rules, all from five suppliers, named one by one.
- **Every other key holds**: items → suppliers 900/900, stock → stores and items 14,982/14,982, ship notices → items 14,244/14,244.
- **Verdicts go back in**: each run writes its verdicts as `reconciled.case_verdicts`; Zetaris checks each points at a live notice and an item we carry; the next run reads them and flags a change.
- **Every write is signed**: a Meterless Scout Intent execution contract names the exact views and tables it may change, single-use, 5-minute expiry.

Map the fragments first. Then trust no one — including the model.

- **The map is a hypothesis the Auditor can send back.** Rows the key can't reach go to the Cartographer, which learns the supplier's rule (padding, dropped check digit) and proves it on all that supplier's ship notices.
- **The model proposes, SQL proves.** For a format the code has no rule for (a 10-digit core), Nemotron 3 Ultra proposes a transform from sampled pairs in a fixed op set; it is adopted only if it holds on every one of the supplier's rows (193 to 390 rows, four suppliers), then written back to Zetaris and checked by its lineage and data-quality rule. Judge off: **89** of 146 caught with known rules, **99** with proposals, **53** without the Cartographer.
- **The Auditor re-derives every number in Zetaris** with differently written SQL; a mismatch blocks the brief.
- **"Cheese ≠ pepperoni"**: a quote can be copied from the notice and still describe another variety — every product word of our item must appear in the notice. An earlier live run: blocked, re-judged, ruled *not ours*.
- **And the other way**: the judge dismissed our Taylor Farms "Salsa Fresca" while quoting "Tomato Salsa Fresca" — every word of ours is in its own quote, so the Auditor sends it to a person (live run, example_1).
- **What the model writes is checked too**: lot codes must appear verbatim in the notice, and every brief sentence must be supported by the evidence it cites, or it is rewritten.
- **Human decisions change the next run** through H-MEM; a changed verdict is flagged against Zetaris.

7 · PRODUCT

fda:H-1396-2026 · GIAS FOOD INC. · 2026-09-03

> Lemon Alfredo Fettuccine packed in a yellow plastic sealed bag with pink and black lettering; label reads in part as...

WHY

The recall notice identifies GIAS FOOD INC. Lemon Alfredo Fettuccine with UPC 194346442706 due to contamination with Listeria monocytogenes E1 E2 E3 E7. Our inventory matches this UPC and holds the specific lots L6079C and L6080C explicitly listed in the notice E8 E9. We currently have 130 units on hand across 4 stores and have sold 102 units to 47 loyalty customers since the recall date of 2026-09-03 E4 E11 E12 E13 E14.

WHAT WE MATCHED

- NW-100069 Lemon Alfredo Fettuccine — **same** (rule, upc): our UPC 194346442706 is printed in the notice

ACTIONS

- Pull lots L6079C, L6080C from 4 store(s): S012 (64), S023 (43), S014 (19), S003 (4) E12
- Send recall notice to loyalty customers who bought affected lots since 2026-09-03: at most 47 E14
- Contact Supplier S028 (synthetic) for credit and replacement E15

CAVEATS

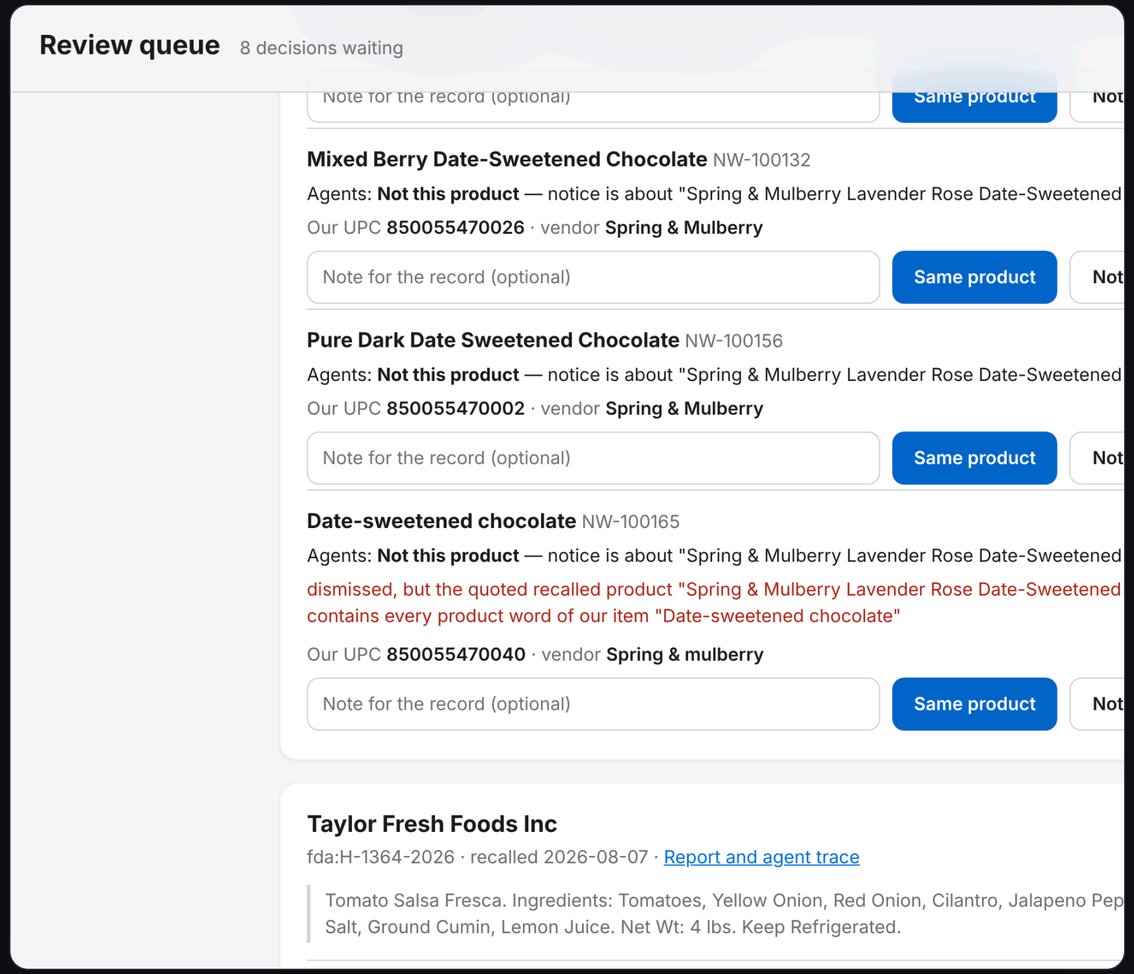

- Retailer stock, sales, lots and ship notices are synthetic (Northwind Mercantile, generated for this demo); food items are real products with real barcodes (USDA FoodData Central, Open Food Facts).
- Customer count sums weekly distinct counts, so it is an upper bound.

EVIDENCE

Each case opens with what the agents did (here: a supplier rule proven by SQL on 391/391 and written back to Zetaris), then the cited brief and the trace.

Review queue 8 decisions waiting

Note for the record (optional) Same product Not

Mixed Berry Date-Sweetened Chocolate NW-100132

Agents: **Not this product** — notice is about "Spring & Mulberry Lavender Rose Date-Sweetened

Our UPC **850055470026** · vendor **Spring & Mulberry**

Note for the record (optional) Same product Not

Pure Dark Date Sweetened Chocolate NW-100156

Agents: **Not this product** — notice is about "Spring & Mulberry Lavender Rose Date-Sweetened

Our UPC **850055470002** · vendor **Spring & Mulberry**

Note for the record (optional) Same product Not

Date-sweetened chocolate NW-100165

Agents: **Not this product** — notice is about "Spring & Mulberry Lavender Rose Date-Sweetened

dismissed, but the quoted recalled product "Spring & Mulberry Lavender Rose Date-Sweetened contains every product word of our item "Date-sweetened chocolate"

Our UPC **850055470040** · vendor **Spring & mulberry**

Note for the record (optional) Same product Not

Taylor Fresh Foods Inc

fda:H-1364-2026 · recalled 2026-08-07 · Report and agent trace

> Tomato Salsa Fresca. Ingredients: Tomatoes, Yellow Onion, Red Onion, Cilantro, Jalapeno Pep
> Salt, Ground Cumin, Lemon Juice. Net Wt: 4 lbs. Keep Refrigerated.

Review screen on a live run's queue: the Auditor's objection to a dismissal, and the decision a person records in Meterless H-MEM. Same screen on the site, no install.

7B · THE WORK IT HANDS ON

Every recall with our stock ends in a packet a person approves.

pull-list.csv

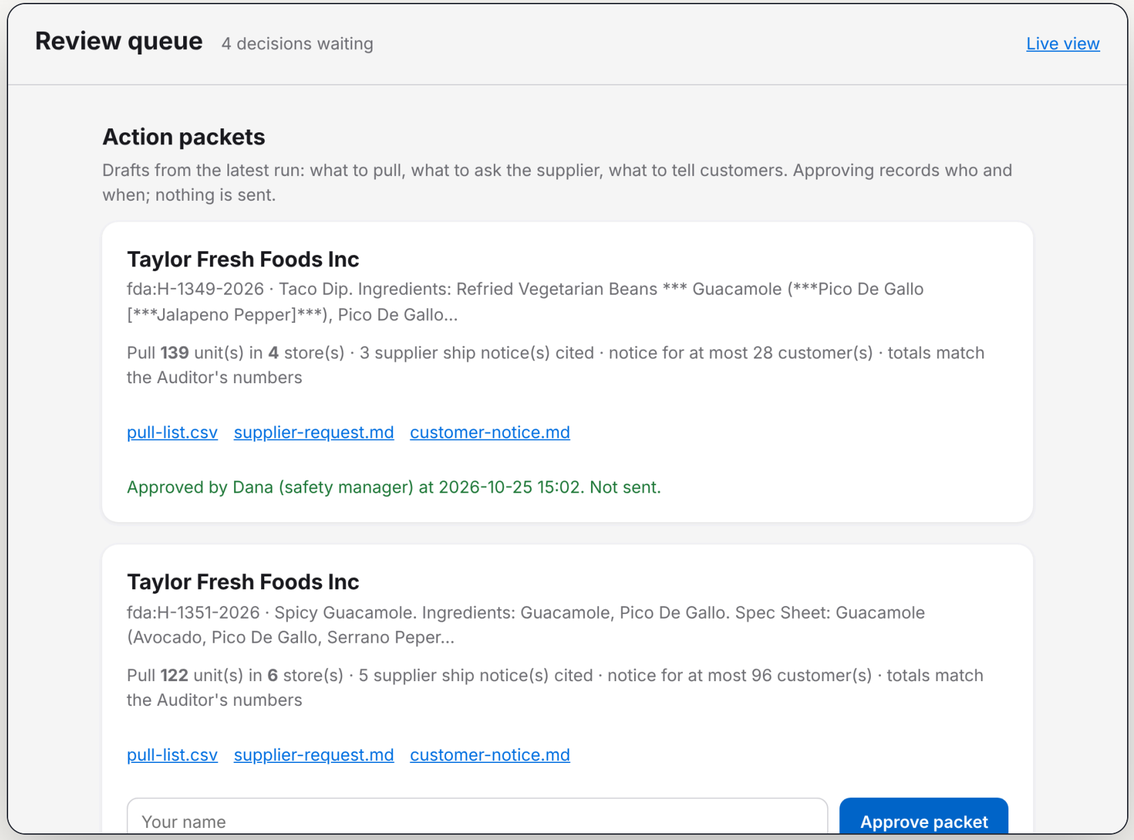

One row per store and lot: store, city, item, UPC, lot, units. **Withheld unless it adds up to the on-hand number the Auditor re-derived with its own SQL.**

supplier-request.md

Credit and replacement request citing the supplier's own ship notices (ASN, lot, date, units), one per supplier.

customer-notice.md

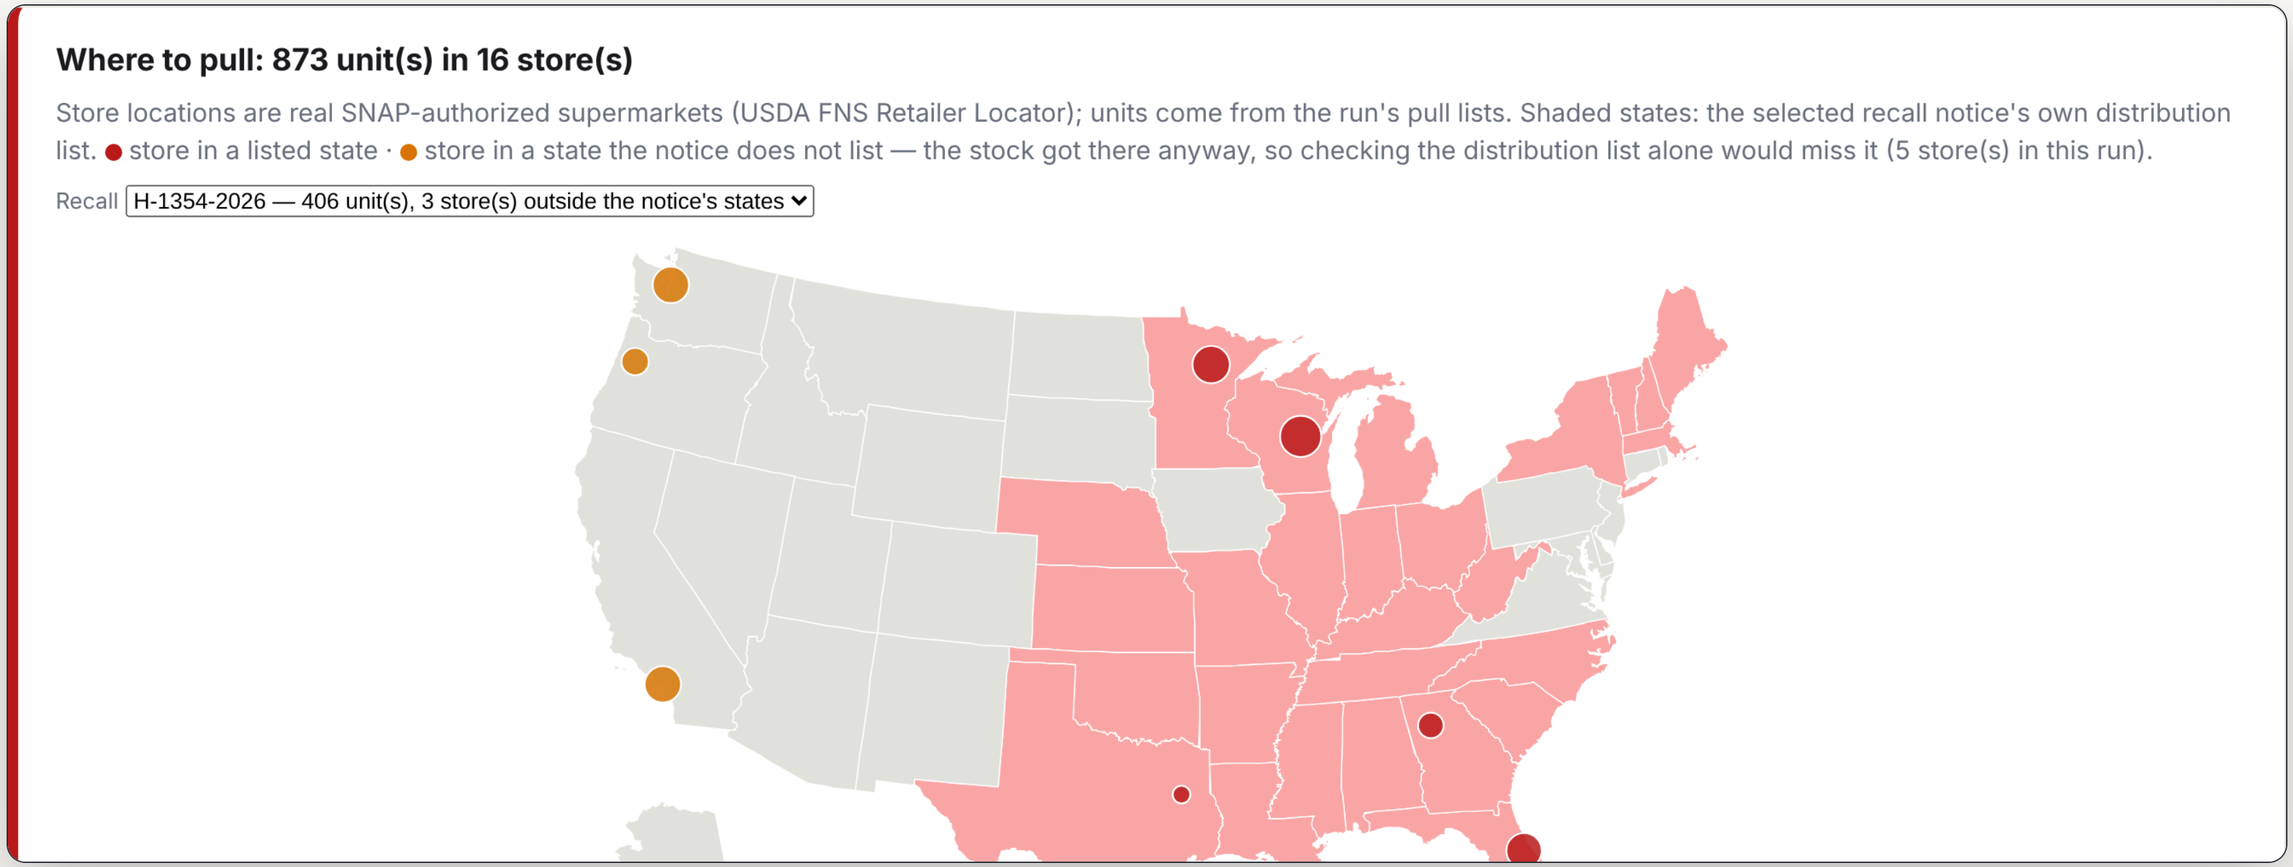

For loyalty customers who bought affected lots — a count; the loyalty system resolves who. Reason quoted from the notice.

Review screen: drafts from the latest run, approved with a name and a time. Nothing is sent. Plus `digest.md`: what needs the manager first, read through Markovian.

7C · WHERE TO PULL

Every pull list on a map of real store locations.

The 24 stores stand at real SNAP-authorized supermarkets (USDA FNS). Shaded: the recall notice's own distribution states. Amber: stock in a state the notice does not list — a check by distribution list alone misses it. Try the review screen with no install: **mikey92.github.io/recallwhy/review.html**

8 · RESULTS

134 of 146 recalled items caught, 1 missed, 1 false alarm — on real products.

SETUP (322 RECALL/SKU PAIRS)	CAUGHT (OF 146)	WRONGLY DISMISSED	FALSE ALARMS (OF 176)	TO HUMAN
No Cartographer — rules only	53	0	0	269
Cartographer, known rules only	89	0	0	233
Cartographer + model-proposed transforms (no judge)	99	0	0	223
Full system: Cartographer + Nemotron 3 Ultra judge + Auditor	**134**	**1**	**1**	**30**

TEXT MATCHES (47 COVERED OF 223)	CAUGHT	WRONGLY DISMISSED	FALSE ALARMS	TO HUMAN
Ultra: judge's first answer	43	4	2	0
Ultra: after the Auditor loop	**45**	**1**	**1**	**20**

292 of 322 pairs (91%) settled without a person, 290 correctly; 30 go to a reviewer with the reason. 0 of 392 model calls failed. On the real products, every recall whose barcode we carry is found by rule (97 of 97), with 0 of 152 false matches.

Real Investigator ⇄ Auditor loop on every candidate pair from 515 recalls (sample-mode data). Food items are real products (USDA FoodData Central, Open Food Facts); stock, sales and ship notices are synthetic. Details: eval/EVAL.md, eval/REAL.md.

9 · NEXT

From demo to a safety desk.

- More feeds through Zetaris: USDA FSIS, NHTSA equipment (car seats), Health Canada
- Lot capture from receiving scans instead of the item master
- Send the approved packet: loyalty system for customers, EDI for the supplier credit, store task system for the pull
- Cartographer onboarding new feeds on its own: catalog → profile → join test
- Real stock and ship notices from a pilot retailer (the food catalog is already real)
- Review screen for a team: assignment, and each decision's history from the H-MEM trust ledger

Limits today: stock, sales and ship notices are synthetic (the food items and store locations are real; no public data holds per-store lots, sales or ship notices); non-food titles come from the notice; proposed transforms are limited to string ops; lexical Auditor checks; CPSC rarely prints UPCs; hosted model rate limits make a full evaluation take over an hour.
